It is understood that the examples described above in no way serve to limit the true

scope of this invention, but rather are presented for illustrative purposes. All publications,
sequences of accession numbers, and patent applications cited in this specification are herein
incorporated by reference as if each individual publication or patent application were
specifically and individually indicated to be incorporated by reference.

WHAT IS CLAIMED IS:

1	1.	A method for determining the presence or absence of a pathological cell in a
2	patient, said n	nethod comprising detecting a nucleic acid comprising a sequence at least 80%
3	identical to a	sequence as described in Tables 2A-68 in a biological sample from said patient,
4	thereby deten	mining the presence or absence of said pathological cell.
1	2.	The method of Claim 1, wherein:
2		d pathology is described in Table 1, including a cancer; and/or
3	•	d biological sample comprises isolated nucleic acids.
,	U) Sai	d biological sample comprises isolated nucleic acids.
1	3.	The method of Claim 1, wherein said biological sample is tissue from an organ
2	which is affect	cted by said pathology of Table 1, including a cancer.
1	4.	The method of Claim 2, wherein said nucleic acids are mRNA
1	5.	The method of Claim 2:
2		ther comprising a step of amplifying nucleic acids before said step of detecting
3		id nucleic acid; or
4		here said detecting is of a protein encoded by said nucleic acid.
7	0) WI	nere said detecting is or a protein encoded by said indiciere acid.
1	6.	The method of Claim 1, wherein said nucleic acid comprises a sequence as
2	described in	Tables 2A-68.
1	7.	The method of Claim 2, wherein:
2	a) sa	id detecting step is carried out by:
3	i)	using a labeled nucleic acid probe;
4	ii	utilizing a biochip comprising a sequence at least 80% identical to a sequence
5		as described in Tables 2A-68, Sr
6	ii	i) detecting a polypeptide encoded by said nucleic acid; or
7	b) sa	id patient is:
8	i)	undergoing a therapeutic regimen to treat said pathology of Table 1; or
9	ii) is suspected of having said pathology or cancer.
1	8.	An isolated nucleic acid molecule comprising a sequence as described in
2	Tables 2A-6	8.

WO 03/025138

2

PCT/US02/29560

9. 1 The nucleic acid molecule of Claim 8, which is labeled. 1 10. An expression vector comprising the nucleic acid of Claim 8. 1 11. A host cell comprising the expression vector of Claim 10. 1 12. An isolated polypeptide which is encoded by a nucleic acid molecule 2 comprising a sequence as described in Tables 2A-68. 13. An antibody that specifically binds a polypeptide of Claim 12. 1 14. The antibody of Claim 13: 1 2 a) conjugated to an effector component; 3 b) conjugated to a detectable label, including a fluorescent label, a radioisotope, or a 4 cytotoxic chemical; 5 c) which is an antibody fragment; or 6 d) which is a humanized antibody. 1 15. A method for specifically targeting a compound to a pathological cell in a 2 patient, said method comprising administering to said patient an antibody of Claim 13, 3 thereby providing said targetting. 1 16. A method for determining the presence or absence of a pathological cell in a 2 patient, said method comprising contacting a biological sample with an antibody of Claim 13. 1 17. The method of Claim 16, wherein: 2 a) said antibody is conjugated to: 3 i) an effector component; or ii) a fluorescent label; or 5 b) said biological sample is a blood, serum, urine, or stool sample. 1 18. A method for identifying a compound that modulates a pathology-associated

polypeptide, said method comprising the steps of:

WO 03/025138

PCT/US02/29560

3	a) contacting said compound with a pathology-associated polypeptide, said
4	polypeptide encoded by a polynucleotide that selectively hybridizes to a sequence
5	at least 80% identical to a sequence as described in Tables 2A-68; and
6	b) determining the functional effect of said compound upon said polypeptide.
1	19. A drug screening assay comprising the steps of:
2	a) administering a test compound to a mammal having a pathology of Table 1 or a
3	cell isolated therefrom; and
4	b) comparing the level of gene expression of a polynucleotide that selectively
5	hybridizes to a sequence at least 80% identical to a sequence as described in
6	Tables 2A-68 in a treated cell or mammal with the level of gene expression of said
7	polynucleotide in a control cell or mammal, wherein a test compound that
8	modulates said level of expression of the polynucleotide is a candidate for the
9	treatment of said pathology.

(54) Title: METHODS OF DIAGNOSIS OF CANCER COMPOSITIONS AND METHODS OF SCREENING FOR MODULATORS OF CANCER

(57) Abstract: Described herein are genes whose expression are up-regulated or down-regulated in specific cancers. Related methods and compositions that can be used for diagnosis and treatment of those cancers are disclosed. Also described herein are methods that can be used to identify modulators of selected cancers.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US02/29560

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)
This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
Claim Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
Claim Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Claim Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)
This International Searching Authority found multiple inventions in this international application, as follows: Please See Continuation Sheet x
As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite
payment of any additional fee. 3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; It is covered by claims Nos.: 1-7 for Specie A(hemangiomas) and B (SEQ ID NO: 1)
Remark on Protest The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.

Form PCT/ISA/210 (continuation of first sheet(1)) (July 1998)

International application No.

PCT/US02/29560

This application contains the following inventions or groups of inventions, which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional examination fees must be paid.

Groups 1-104,648, claim(s) 1-7, drawn to a method for determining the presence or absence of a pathological (Specie A) cell in a patient via detection of polynucleotides that are at least 80% identical to listed sequences (Specie B). If electing from this Group Set, Applicants are asked to elect one species from A and B. Species A has 254 possibilities (see Table 1). Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions in this Group Set including all possible combinations of Species A and B is 104,648.

Groups 104,649-105,060, claim(s) 8-12, drawn to an isolated nucleic acid molecules from Tables 2A-68, expression vectors, host cells, and polypeptides encoded by nucleic acid molecules with listed sequences from Tables 2A-68 (Species B). If electing from this Group Set, Applicants are asked to elect one species from Species B. Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions possible in this Group Set with Specie B is 412.

Groups 105,061-105,472, claim(s) 13-14, drawn to an antibody that binds to a polypeptide encoded by a polynucleotide with sequences from Tables 2A-68 (Species B). If electing from this Group Set, Applicants are asked to elect one species from Species B. Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions possible in this Group Set with Specie B is 412.

Groups 105,473-105,884, claim(s) 15, drawn to a method for targeting a compound to a pathological cell in a patient via administering an antibody that binds to a polypeptide encoded by a polynucleotide from Tables 2A-68 (Species B). If electing from this Group Set, Applicants are asked to elect one species from Species B. Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions possible in this Group Set with Specie B is 412.

Groups 105,885-106,296, claim(s) 16-17, drawn to a method for determining the presence or absence of a pathological cell in a patient via contacting the sample with an antibody that binds to a polypeptide encoded by a polynucleotide from Tables 2A-68 (Species B). If electing from this Group Set, Applicants are asked to elect one species from Species B. Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions possible in this Group Set with Specie B is 412.

Groups 106,297-106,708, claim(s) 18, drawn to a method for identifying a compound that modulates a pathology-associated polypeptide encoded by a polynucleotide that hybridizes to a sequence in Tables 2A-68 (Species B). If electing from this Group Set, Applicants are asked to elect one species from Species B. Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions possible in this Group Set with Specie B is 412.

Groups 106,709-211,356, claim(s) 19, drawn to drug screening assay by administering a compound to a mammal or cell having a pathology (of Table 1) and comparing the level of gene expression of a polynucleotide that hybridizes to a sequence that is 80% identical to sequences as described in Tables 2A-68 (Species B) to gene expression in control cells or mammals. If electing from this Group Set, Applicants are asked to elect one species from A and B. Species A has 254 possibilities (see Table 1). Please note that the sequences in Tables 2A-68 are unsearchable as they are not included in the Sequence Listing. Applicants have supplied 412 nucleic acid sequences from which a selection can be made for Specie B. The total number of individual inventions in this Group Set including all possible combinations of Species A and B is 104,648.

This International Searching Authority considers that the international application does not comply with the requirements of unity of invention (Rules 13.1, 13.2, and 13.3) for the reasons indicated below:

The inventions listed as all Group Sets (Groups 1-211,356) do not relate to a single general inventive concept under PCT Rule 13.1, because under PCT Rule 13.2 they lack the same or corresponding special technical features for the following reasons:

Groups 1-104,648 and Groups 105,472-211,356 are directed to methods or assays which vary in one or more of the following: reactants, steps, and/or goals which are not coextensive and which do not share the same technical feature. Groups 104,649-105,472 have two separate special technical features, a nucleic acid and an antibody, respectively. These are directed to different chemical entity types regarding the critical limitations featuring different structures and functions. The antibodies undergo recognition and binding reactions

wherein what is bound is different from what is bound by the compositions including the nucleic acids. Thus, in summary, each Group is directed to a different special technical feature and thus supports this lack of unity.

This application contains claims directed to more than one species of the generic invention. These species are deemed to lack unity of invention because they are not so linked as to form a single general inventive concept under PCT Rule 13.1.

In order for more than one species to be examined, the appropriate additional examination fees must be paid. The species are as follows:

The claims in the Groups 1-104,648 and 106,709-211,356 include a series of species A directed to different pathologies which are listed in Table 1. Each of these types of pathologies are separate entities which affect patients differently, meaning each has its own special technical feature.

The claims in all Groups (1-211,356) include a series of species B directed to nucleic acid sequence listed (412 possibilities) which are considered separate as each defines its own special technical feature.

The first listed pathology (Specie A) and SBQ ID NO: 1 (Species B) will be automatically searched. For each additional Group with a specie combination elected, the fee is an additional \$210.00.
